

DEPARTMENT OF MATHEMATICS  
UNIVERSITY OF MARYLAND  
GRADUATE WRITTEN EXAM

January, 1996

LOGIC

1. a) Let  $L$  be a language whose non-logical symbols include the binary relation  $E$ . Let  $T$  be a theory of  $L$  such that  $E^{\mathcal{A}}$  is an equivalence relation on  $A$  for every model  $\mathcal{A}$  of  $T$ . Assume that in every model  $\mathcal{A}$  of  $T$  there is exactly one infinite  $E^{\mathcal{A}}$ -class. Prove that there is some  $n$  in  $\omega$  such that in every model  $\mathcal{A}$  of  $T$ , all finite  $E^{\mathcal{A}}$ -classes have at most  $n$  elements.

b) Let  $T$  be a complete theory of some language  $L$  and let  $\Phi(x)$  be an  $L$ -type consistent with  $T$ . Assume that  $\Phi$  is omitted on some model of  $T$ . Prove that  $\Phi$  is realized in some model of  $T$  by at least two different elements.

2. a) Let  $T$  be a complete theory in a countable language  $L$  and let  $\mathcal{A}$  be the prime model of  $T$ . Let  $\Phi(x)$  be any  $L$ -type. Prove that there is some  $L$ -type  $\Psi(x)$  such that  $\Psi^{\mathcal{A}} = A \setminus \Phi^{\mathcal{A}}$ .

b) Let  $L$  be a countable language and let  $L' = L \cup \{c_1, \dots, c_k\}$ , where  $c_1, \dots, c_k$  are individual constants not in  $L$ . Let  $T$  and  $T'$  be complete theories of  $L$  and  $L'$  respectively and assume  $T \subseteq T'$ . Prove that  $T$  has a countable universal model iff  $T'$  has a countable universal model.

3. a) Let  $L$  be a countable language. An  $L$ -structure  $\mathcal{A}$  is said to be *locally finite* iff every element of  $A$  belongs to a finite  $L$ -definable subset of  $A$ . Let  $T$  be a complete  $L$ -theory and assume that no model of  $T$  is locally finite. Prove that there is some  $L$ -formula  $\phi(x)$  consistent with  $T$  such that for every  $L$ -formula  $\psi(x)$  and every model  $\mathcal{A}$  of  $T$ ,  $\phi^{\mathcal{A}} \cap \psi^{\mathcal{A}}$  is infinite provided it is not empty.

b) Let  $T$  be a complete theory in a countable language  $L$ . Let  $\mathcal{A}$  be a countable model of  $T$  which is not prime and let  $\Phi(x)$  be a type omitted on  $\mathcal{A}$ . Prove that there is some countable model of  $T$  which also omits  $\Phi$  but is not isomorphic to  $\mathcal{A}$ .

[Warning: You cannot assume that  $T$  has a prime model.]

4. a) Assume that  $A$  and  $B$  are r.e. subsets of  $\omega$  such that  $A \cup B$  is recursive. Prove that there are recursive subsets  $A' \subseteq A$  and  $B' \subseteq B$  such that  $A \cup B = A' \cup B'$ .

b) Recall that if  $\phi(x)$  is a  $\Sigma$ -formula (in the language for arithmetic on the natural numbers) and if  $Q \vdash \exists x\phi(x)$  then  $Q \vdash \phi(\bar{n})$  for some  $n$  in  $\omega$ . Prove that there is no total recursive function  $f$  such that whenever  $\phi(x)$  is a  $\Sigma$ -formula and  $Q \vdash \exists x\phi(x)$ , then  $Q \vdash \phi(\bar{f(k)})$ , where  $k = \lceil \phi \rceil$ .

[Hint: Let  $\phi(x, y)$  be the  $\Sigma$ -formula representing in  $Q$  the relation “ $x$  is the Gödel number of a proof from  $Q$  of the sentence whose Gödel number is  $y$ ” and consider the formulas  $\phi_l(x) = \psi(x, \bar{l})$ .]

5. a) Given a language  $L_1$ , let  $L_2 = L_1 \cup \{c\}$ , where  $c$  is an individual constant not in  $L_1$ . Let  $T_2$  be a finitely axiomatizable, essentially undecidable theory of  $L_2$  and let  $T_1 = T_2 \cap Sn_{L_1}$ . Prove that  $T_1$  is also essentially undecidable.

b) Prove that  $\{e : W_e \neq \omega\} \leq_m \{e : W_e \text{ is finite}\}$ .

[Hint: First define a partial recursive function  $f(e, x)$  which converges iff  $\{e\}(y)$  converges for all  $y < x$ .]

6. a) Let  $A$  and  $B$  be subsets of  $\omega$ . Prove that  $B$  is  $A$ -r.e. iff  $B \leq_m A'$ , where  $A'$  is the jump of  $A$ .

b) Let  $C = \{[\sigma] : \mathbf{N} \models \sigma\}$ , where  $\mathbf{N}$  is the standard model of arithmetic on the natural numbers. Prove that  $A \leq_T C$  for all arithmetic sets  $A$ , and use this to conclude that  $C$  is not arithmetic.
