

$$M = \iint_R y \, dA = \int_1^2 \int_0^{2y} y \, dx \, dy \quad [5 \text{ pts}]$$

$$= \int_1^2 y(x) \Big|_{x=0}^{2y} dy = \int_1^2 2y^2 dy \quad [3 \text{ pts}]$$

$$= 2 \left[\frac{y^3}{3} \right] \Big|_1^2 = 2 \cdot \frac{8}{3} = \frac{16}{3} \quad [2 \text{ pts}]$$

2. $V = \iint_R (4+x+2y) \, dA$ where R is the region bounded by

the circle $x^2+y^2=1$ in the xy-plane. [3 pts]

[Grader : Students are not required to sketch R.]

Polar coordinates : $x=r\cos\theta, y=r\sin\theta$, where $0 \leq r \leq 1, 0 \leq \theta < 2\pi$ [1 pt]

$$V = \int_0^{2\pi} \int_0^1 (4+r\cos\theta+2r\sin\theta) r \, dr \, d\theta \quad [2 \text{ pts}]$$

$$= \int_0^{2\pi} \left[4 \frac{r^2}{2} + (\cos\theta+2\sin\theta) \frac{r^3}{3} \right] \Big|_{r=0}^1 d\theta = \int_0^{2\pi} \left[2 + \frac{1}{3}(\cos\theta+2\sin\theta) \right] d\theta \quad [2 \text{ pts}]$$

$$= \left[2\theta + \frac{1}{3}(\sin\theta-2\cos\theta) \right] \Big|_0^{2\pi} = 2 \cdot 2\pi = 4\pi \quad [2 \text{ pts}]$$

3. (a) The mass density of the object is $\delta(x,y,z) = \sqrt{x^2+y^2+z^2}$ [1pt]

The total mass of the object is

$$m = \iiint_D \delta(x,y,z) dy = \iiint_D \sqrt{x^2+y^2+z^2} dy \quad [1pt]$$

(b) We use spherical coordinates (ρ, φ, θ) , where

$$x = \rho \sin \varphi \cos \theta, \quad y = \rho \sin \varphi \sin \theta, \quad z = \rho \cos \varphi; \quad 0 \leq \theta < 2\pi, \quad 0 \leq \varphi \leq \varphi_0, \quad 1 \leq \rho \leq 2 \quad [1pt]$$

[Grader]: The students may use any other reasonable coordinate system.

They are not required to sketch solid region D .]

The angle φ_0 must be determined by the equation for the cone.

$$3z^2 = x^2 + y^2 \Rightarrow 3\rho^2 \cos^2 \varphi_0 = \rho^2 \sin^2 \varphi_0$$

$$\Rightarrow \tan^2 \varphi_0 = 3 \Rightarrow \tan \varphi_0 = \sqrt{3} \Rightarrow \varphi_0 = \frac{\pi}{3} \quad [2pts] \\ (\text{since } 0 < \varphi_0 < \frac{\pi}{2})$$

$$m = \int_0^{2\pi} \int_0^{\frac{\pi}{3}} \int_1^2 \rho \rho^2 \sin \varphi d\rho d\varphi d\theta \quad [2pts]$$

$$= \int_0^{2\pi} \int_0^{\frac{\pi}{3}} \left[\frac{\rho^4}{4} \right]_1^2 \sin \varphi d\varphi d\theta = \frac{15}{4} \int_0^{2\pi} \int_0^{\frac{\pi}{3}} \sin \varphi d\varphi d\theta \quad [1pt]$$

$$= \frac{15}{4} \int_0^{2\pi} [-\cos \varphi] \Big|_0^{\frac{\pi}{3}} d\theta = \frac{15}{4} \cdot (1 - \cos \frac{\pi}{3}) 2\pi \quad [1pt]$$

$$= \frac{15}{4} (1 - \frac{1}{2}) 2\pi = \frac{15\pi}{4} \quad [1pt]$$

[4] (a) The desired transformation is

$$u = \frac{x}{4}, \quad v = \frac{y}{3},$$

[2pts]

by which

$$x = 4u \quad \text{and} \quad y = 3v$$

[1pt]

(b) The double integral over the region S of uv -plane reads

$$I = \iint_S (1+u^2+v^2)^{5/2} |J| dA$$

Jacobian

[1pt]

where S is the region bounded by the circle $u^2+v^2=1$.

[Grader]: Students are not required to sketch region S .]

Jacobian : $J = \frac{\partial(x,y)}{\partial(u,v)} = \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{vmatrix} = \begin{vmatrix} 4 & 0 \\ 0 & 3 \end{vmatrix} = 12.$ [2pts]

Thus,

$$I = 12 \iint_S (1+u^2+v^2)^{5/2} dA$$

To compute I , we use polar coordinates :

$$\begin{aligned} u &= r\cos\theta & 0 \leq r \leq 1 \\ v &= r\sin\theta & 0 \leq \theta \leq 2\pi \end{aligned}$$

[1pt]

$$I = 12 \int_0^{2\pi} \int_0^1 (1+r^2)^{5/2} r dr d\theta$$

[2pts]

$$= 12 \cdot 2\pi \left[\frac{1}{7} (1+r^2)^{7/2} \right] \Big|_0^1 = 24\pi \frac{1}{7} (2^{7/2} - 1)$$

[1pt]
