

Information Sheet
MATH464 Fall 2013
Transform Methods for Scientists and Engineers

Instructor: Radu Balan

Lectures: Tuesday, Thursday, 11:00am-12:30pm, CSIC 4122.

Office Hours: Tuesday, 12:30-1:30pm; in CSIC 4131

Contact Information: Email rvbalan@math.umd.edu, Math Building, Room 2308, x55492 / CSCAMM, Room 4131, x51217

Website: <http://www-users.math.umd.edu/~rvbalan/TEACHING/MATH464Spring2013/index.html>

MATH 464 is an introduction to transform methods used in science and engineering applications. Lectures cover topics including: Fourier transform, Fourier series, discrete and fast Fourier transform (DFT and FFT). Laplace transform. Poisson summation, and sampling. Optional Topics: Distributions and operational calculus, PDEs, Wavelet transform, Radon transform. Applications: Imaging, Speech Processing, PDEs of Mathematical Physics, Communications, Inverse Problems.

Prerequisite: MATH 246

Required Textbook: *A First Course in Fourier Analysis*, David W. Kammler, Cambridge University Press 2007

Additional Reading Materials:

Introduction to the Mathematics of Medical Imaging, Charles L. Epstein, SIAM 2008

Analysis, Elliott H. Lieb and Michael Loss, AMS 2001.

Harmonic Analysis and Applications, John J. Benedetto, CRC Press 1996

Grading. There will be two mid-term exams (100 points each), homework assignments (for a total of 100 points), and a final exam (200 points). Students are allowed one single-sided “cheat sheet” during the mid-terms, and two double-sided “cheat sheet” during the final.

Exam dates: Mid-terms will be scheduled during regular class time. Final exam: Monday, December 16, 8:00am-10:00am.

Homeworks. Homework must be submitted on the date assigned. Homework must be prepared without consulting any other person. You may however consult any written reference. In this case you should cite the reference. Results taken from the reference should be (re)stated to the notation used in the course. Explanations should be given in complete English sentences. Written work must be legible and clear.

Academic Integrity. You are expected to adhere to the University’s Code of Academic Integrity, available on the University’s web site, at: <https://www.shc.umd.edu>

Students with Disabilities: If you have a documented disability and wish to discuss academic accommodations with me, please contact me as soon as possible.

Religious Observances. If you will be absent from class because of religious observances, please submit a list of the dates of your absences within a couple of days.

Syllabus
MATH 464 / Fall 2013
Transform Methods for Scientists and Engineers

Required Textbook: *A First Course in Fourier Analysis*, David W. Kammler, Cambridge University Press 2007

1. Introduction
 - a. Sets, Functions, Continuity, Integrability
 - b. Motivating Examples: Heat Equation, Image Processing
2. Fourier transform
 - a. Fourier Series
 - b. Definition for L^1 functions
 - c. Plancherel Theorem. Extension to L^2
 - d. Inversion formulae
 - e. Algebraic and Analytic properties of Fourier transform
 - f. Pointwise convergence results
 - g. Convolution.
3. Sampling Theory
 - a. Bandlimited functions
 - b. The Shannon-Kotel'nikov-Whittaker sampling formula
 - c. Poisson Summation Formula
 - d. Application: A/D Convertors
4. Windowed Fourier Transform
 - a. Local information content: time and frequency localization
 - b. Spectrograms and Short-Time Fourier Transforms/windowed Fourier transform
 - c. Discrete time STFT/Applications to Audio Signal Processing
5. Wavelet Transform
 - a. The continuous wavelet transform
 - b. The Haar Example. Filterbank implementation
 - c. Multiresolution Analysis (MRA) Wavelets
 - d. Compactly supported wavelets: The Daubechies Class
- ~~6. Generalized Functions (Tempered Distributions)~~
 - ~~a. Test functions. Properties~~
 - ~~b. Tempered distributions: Fourier Transform and Differential Calculus~~
- ~~7. Applications to Partial Differential Equations~~
 - ~~a. Heat equation~~
 - ~~b. Wave equation~~
