We start from our PTW model :

$$\frac{d\vec{x}}{dt} = \vec{v}(\theta)$$

$$\frac{d\theta}{dt} = \kappa$$

$$d\kappa = -\kappa dt + \sqrt{2\alpha} dB_t$$

The density distribution of particles $f(t, x, \theta, \kappa)$ satisfies (Fokker-Planck equation) :

Introduction

Motivation

Work plan

Example : ant displacement

A new model for fish behavior

Experiments for fish

Model PTW

Macroscopic model of PTW

Vicsek model

Introduction

Kinetic equation

Macroscopic equation

Numeric

We start from our PTW model :

$$\frac{d\vec{x}}{dt} = \vec{\tau}(\theta)$$

$$\frac{d\theta}{dt} = \kappa$$

$$d\kappa = -\kappa dt + \sqrt{2}\alpha dB_t$$

The density distribution of particles $f(t, x, \theta, \kappa)$ satisfies (Fokker-Planck equation) :

$$\partial_t f + \vec{\tau} \cdot \nabla_{\vec{x}} f = Lf.$$

with

$$Lf = -\kappa \partial_{\theta} f + \partial_{\kappa}(\kappa f) + \alpha^2 \partial_{\kappa^2} f$$

Introduction

Kinetic equation

Macroscopic equation

Numeric

Integrating equation (1) in (θ, κ)

$$\int_{\theta, \kappa} (\varepsilon \partial_t f^\varepsilon + \vec{\tau} \cdot \nabla_{\vec{x}} f^\varepsilon = \frac{1}{\varepsilon} L f^\varepsilon) d\theta d\kappa$$

we have the equation of mass conservation :

$$\partial_t \rho^\varepsilon + \nabla_{\vec{x}} \cdot \mathbf{J}^\varepsilon = 0,$$

where

$$\rho^\varepsilon(t, \vec{x}) = \int_{\theta, \kappa} f^\varepsilon d\kappa d\theta, \quad \mathbf{J}^\varepsilon(t, \vec{x}) = \int_{\theta, \kappa} \frac{f^\varepsilon}{\varepsilon} \vec{\tau}(\theta) d\kappa d\theta.$$

Inserting the Hilbert expansion in the expression of the flux J^ε :

$$\begin{aligned} J^\varepsilon(t, \vec{x}) &= \frac{1}{\varepsilon} \int_{\theta, \kappa} f^\varepsilon \vec{\tau}(\theta) d\kappa d\theta \\ &= \int_{\theta, \kappa} f^1 \vec{\tau}(\theta) d\kappa d\theta + O(\varepsilon), \end{aligned}$$

we have at the limit $\varepsilon \rightarrow 0$:

$$J^0(t, \vec{x}) = - \left(\int_{\theta, \kappa} \vec{\tau} \otimes \vec{\chi} d\theta d\kappa \right) \nabla_{\vec{x}} \rho^0.$$
