Surfaces

Surface groups

$SL(2, \mathbb{R})$

$SL(2, \mathbb{C})$

$SU(2, 1)$

$SL(3, \mathbb{R})$

$Aff(2, \mathbb{R})$

Let Σ be a compact surface of $\chi(\Sigma) < 0$ with fundamental group $\pi = \pi_1(\Sigma)$.

- Since π is finitely generated, $\text{Hom}(\pi, G)$ is an algebraic set, for any algebraic Lie group G .
- This algebraic structure is invariant under the natural action of $\text{Aut}(\pi) \times \text{Aut}(G)$.
- The *mapping class group* $\text{Mod}(\Sigma) \cong \text{Aut}(\pi)/\text{Inn}(\pi)$ acts on $\text{Hom}(\pi, G)/G$.

Representations of surface groups

Hyperbolizing
Surfaces

Surface groups

$SL(2, \mathbb{R})$

$SL(2, \mathbb{C})$

$SU(2, 1)$

$SL(3, \mathbb{R})$

$Aff(2, \mathbb{R})$

Let Σ be a compact surface of $\chi(\Sigma) < 0$ with fundamental group $\pi = \pi_1(\Sigma)$.

- Since π is finitely generated, $\text{Hom}(\pi, G)$ is an algebraic set, for any algebraic Lie group G .
- This algebraic structure is invariant under the natural action of $\text{Aut}(\pi) \times \text{Aut}(G)$.
- The *mapping class group* $\text{Mod}(\Sigma) \cong \text{Aut}(\pi)/\text{Inn}(\pi)$ acts on $\text{Hom}(\pi, G)/G$.
- Representations $\pi \longrightarrow G$ arise from *locally homogeneous geometric structures* on Σ , modelled on homogeneous spaces of G .

Navigating the deformation space

Hyperbolizing
Surfaces

Surface groups

$SL(2, \mathbb{R})$

$SL(2, \mathbb{C})$

$SU(2, 1)$

$SL(3, \mathbb{R})$

$Aff(2, \mathbb{R})$

- The fundamental group $\pi = \pi_1(\Sigma)$ is the fundamental group of a closed orientable surface admits a presentation

$$\pi = \langle A_1, \dots, B_g \mid A_1 B_1 A_1^{-1} B_1^{-1} \dots A_g B_g A_g^{-1} B_g^{-1} = 1 \rangle$$

Navigating the deformation space

Hyperbolizing
Surfaces

Surface groups

$SL(2, \mathbb{R})$

$SL(2, \mathbb{C})$

$SU(2, 1)$

$SL(3, \mathbb{R})$

$Aff(2, \mathbb{R})$

- The fundamental group $\pi = \pi_1(\Sigma)$ is the fundamental group of a closed orientable surface admits a presentation

$$\pi = \langle A_1, \dots, B_g \mid A_1 B_1 A_1^{-1} B_1^{-1} \dots A_g B_g A_g^{-1} B_g^{-1} = 1 \rangle$$

- Associated to simple closed curves $\alpha \subset \Sigma$ are *generalized twist deformations*, paths in $\text{Hom}(\pi, G)$ supported on α .

Navigating the deformation space

Hyperbolizing
Surfaces

Surface groups

$SL(2, \mathbb{R})$

$SL(2, \mathbb{C})$

$SU(2, 1)$

$SL(3, \mathbb{R})$

$Aff(2, \mathbb{R})$

- The fundamental group $\pi = \pi_1(\Sigma)$ is the fundamental group of a closed orientable surface admits a presentation

$$\pi = \langle A_1, \dots, B_g \mid A_1 B_1 A_1^{-1} B_1^{-1} \dots A_g B_g A_g^{-1} B_g^{-1} = 1 \rangle$$

- Associated to simple closed curves $\alpha \subset \Sigma$ are *generalized twist deformations*, paths in $\text{Hom}(\pi, G)$ supported on α .
- For example, if α is the nonseparating simple loop A_1 :

$$\rho_t : \begin{cases} A_i & \longmapsto \rho(A_i) \text{ if } i \geq 1 \\ B_j & \longmapsto \rho(B_j) \text{ if } j > 1 \\ B_1 & \longmapsto \rho(B_1)\zeta(t) \end{cases}$$

where $\zeta(t)$ is a path in the centralizer of $\rho(A_1)$.

Generalized twist flows

Hyperbolizing
Surfaces

Surface groups

$SL(2, \mathbb{R})$

$SL(2, \mathbb{C})$

$SU(2, 1)$

$SL(3, \mathbb{R})$

$Aff(2, \mathbb{R})$

- Similarly if $C = [A_1, B_1] \dots [A_k, B_k]$ corresponds to a *separating simple loop* on Σ , then

$$\rho_t : \begin{cases} A_i & \mapsto \rho(A_i) \text{ if } i \leq k \\ B_i & \mapsto \rho(B_i) \text{ if } i \leq k \\ A_i & \mapsto \zeta(t)\rho(A_i)\zeta(t)^{-1} \text{ if } i > k \\ B_i & \mapsto \zeta(t)\rho(B_i)\zeta(t)^{-1} \text{ if } i > k \end{cases}$$

where $\zeta(t)$ is a path in the centralizer of $\rho(C)$.

Generalized twist flows

Hyperbolizing
Surfaces

Surface groups

$SL(2, \mathbb{R})$

$SL(2, \mathbb{C})$

$SU(2, 1)$

$SL(3, \mathbb{R})$

$Aff(2, \mathbb{R})$

- Similarly if $C = [A_1, B_1] \dots [A_k, B_k]$ corresponds to a *separating simple loop* on Σ , then

$$\rho_t : \begin{cases} A_i & \mapsto \rho(A_i) \text{ if } i \leq k \\ B_i & \mapsto \rho(B_i) \text{ if } i \leq k \\ A_i & \mapsto \zeta(t)\rho(A_i)\zeta(t)^{-1} \text{ if } i > k \\ B_i & \mapsto \zeta(t)\rho(B_i)\zeta(t)^{-1} \text{ if } i > k \end{cases}$$

where $\zeta(t)$ is a path in the centralizer of $\rho(C)$.

- Example for $G = SL(2, \mathbb{R})$: When $\rho(A_1)$ leaves invariant a geodesic $l \subset \mathbb{H}^2$, then $\zeta(t)$ is a group of *transvections* along l .

Observing the deformation space

Hyperbolizing
Surfaces

Surface groups

$SL(2, \mathbb{R})$

$SL(2, \mathbb{C})$

$SU(2, 1)$

$SL(3, \mathbb{R})$

$Aff(2, \mathbb{R})$

- A natural class of functions on $\text{Hom}(\pi, G)/G$ arise from functions $G \xrightarrow{f} \mathbb{R}$ invariant under conjugation and $\alpha \in \pi$:

$$\begin{aligned} \text{Hom}(\pi, G)/G &\xrightarrow{f_\alpha} \mathbb{R} \\ [\rho] &\longmapsto f(\rho(\gamma)) \end{aligned}$$

Observing the deformation space

Hyperbolizing
Surfaces

Surface groups

$SL(2, \mathbb{R})$

$SL(2, \mathbb{C})$

$SU(2, 1)$

$SL(3, \mathbb{R})$

$Aff(2, \mathbb{R})$

- A natural class of functions on $\text{Hom}(\pi, G)/G$ arise from functions $G \xrightarrow{f} \mathbb{R}$ invariant under conjugation and $\alpha \in \pi$:

$$\begin{aligned} \text{Hom}(\pi, G)/G &\xrightarrow{f_\alpha} \mathbb{R} \\ [\rho] &\longmapsto f(\rho(\gamma)) \end{aligned}$$

- The *trace* of any linear representation $G \longrightarrow GL(N, \mathbb{R})$

Observing the deformation space

Hyperbolizing
Surfaces

Surface groups

$SL(2, \mathbb{R})$

$SL(2, \mathbb{C})$

$SU(2, 1)$

$SL(3, \mathbb{R})$

$Aff(2, \mathbb{R})$

- A natural class of functions on $\text{Hom}(\pi, G)/G$ arise from functions $G \xrightarrow{f} \mathbb{R}$ invariant under conjugation and $\alpha \in \pi$:

$$\begin{aligned} \text{Hom}(\pi, G)/G &\xrightarrow{f_\alpha} \mathbb{R} \\ [\rho] &\longmapsto f(\rho(\gamma)) \end{aligned}$$

- The *trace* of any linear representation $G \longrightarrow GL(N, \mathbb{R})$
- The *geodesic displacement function* (only defined for hyperbolic elements)

$$\text{tr}(\gamma) = \pm 2 \cosh(\ell(\gamma)/2)$$

if $\gamma \in SL(2, \mathbb{R})$ is hyperbolic.

Symplectic structure

Hyperbolizing
Surfaces

Surface groups

$SL(2, \mathbb{R})$

$SL(2, \mathbb{C})$

$SU(2, 1)$

$SL(3, \mathbb{R})$

$Aff(2, \mathbb{R})$

- When G possesses a nondegenerate *bi-invariant* pseudo-Riemannian metric, $\text{Hom}(\pi, G)/G$ inherits a $\text{Mod}(\Sigma)$ -invariant *symplectic structure*.

Symplectic structure

Hyperbolizing
Surfaces

Surface groups

$SL(2, \mathbb{R})$

$SL(2, \mathbb{C})$

$SU(2, 1)$

$SL(3, \mathbb{R})$

$Aff(2, \mathbb{R})$

- When G possesses a nondegenerate *bi-invariant* pseudo-Riemannian metric, $\text{Hom}(\pi, G)/G$ inherits a $\text{Mod}(\Sigma)$ -invariant *symplectic structure*.
- When $G = \mathbb{R}$ or \mathbb{C} , then $\text{Hom}(\pi, G)$ is a real (or complex) *symplectic vector space* $H^1(\Sigma)$.

Symplectic structure

Hyperbolizing
Surfaces

Surface groups

$SL(2, \mathbb{R})$

$SL(2, \mathbb{C})$

$SU(2, 1)$

$SL(3, \mathbb{R})$

$Aff(2, \mathbb{R})$

- When G possesses a nondegenerate *bi-invariant* pseudo-Riemannian metric, $\text{Hom}(\pi, G)/G$ inherits a $\text{Mod}(\Sigma)$ -invariant *symplectic structure*.
- When $G = \mathbb{R}$ or \mathbb{C} , then $\text{Hom}(\pi, G)$ is a real (or complex) *symplectic vector space* $H^1(\Sigma)$.
- The $\text{Mod}(\Sigma)$ -action is the symplectic representation

$$\text{Mod}(\Sigma) \longrightarrow \text{Sp}(2g, \mathbb{Z}).$$

Symplectic structure

Hyperbolizing
Surfaces

Surface groups

$SL(2, \mathbb{R})$

$SL(2, \mathbb{C})$

$SU(2, 1)$

$SL(3, \mathbb{R})$

$Aff(2, \mathbb{R})$

- When G possesses a nondegenerate *bi-invariant* pseudo-Riemannian metric, $\text{Hom}(\pi, G)/G$ inherits a $\text{Mod}(\Sigma)$ -invariant *symplectic structure*.
- When $G = \mathbb{R}$ or \mathbb{C} , then $\text{Hom}(\pi, G)$ is a real (or complex) *symplectic vector space* $H^1(\Sigma)$.
- The $\text{Mod}(\Sigma)$ -action is the symplectic representation

$$\text{Mod}(\Sigma) \longrightarrow \text{Sp}(2g, \mathbb{Z}).$$

- When α is represented by a simple closed curve, and $G \xrightarrow{f} \mathbb{R}$ is an invariant function, then the Hamiltonian flow of f_α is covered by a *generalized twist flow* on $\text{Hom}(\pi, G)$.

Fricke space

Hyperbolizing
Surfaces

Surface groups

$SL(2, \mathbb{R})$

$SL(2, \mathbb{C})$

$SU(2, 1)$

$SL(3, \mathbb{R})$

$Aff(2, \mathbb{R})$

- The deformation space $\mathfrak{F}(\Sigma)$ of marked hyperbolic structures Σ identifies with the space of embeddings

$$\pi := \pi_1(\Sigma) \xrightarrow{\rho} \mathrm{PSL}(2, \mathbb{R})$$

onto *discrete subgroups*.

Fricke space

Hyperbolizing
Surfaces

Surface groups

$SL(2, \mathbb{R})$

$SL(2, \mathbb{C})$

$SU(2, 1)$

$SL(3, \mathbb{R})$

$Aff(2, \mathbb{R})$

- The deformation space $\mathfrak{F}(\Sigma)$ of marked hyperbolic structures Σ identifies with the space of embeddings

$$\pi := \pi_1(\Sigma) \xrightarrow{\rho} \mathrm{PSL}(2, \mathbb{R})$$

onto *discrete subgroups*.

- Furthermore if $\gamma \neq 1$, then $\rho(\gamma)$ is hyperbolic.

Fricke space

Hyperbolizing
Surfaces

Surface groups

$SL(2, \mathbb{R})$

$SL(2, \mathbb{C})$

$SU(2, 1)$

$SL(3, \mathbb{R})$

$Aff(2, \mathbb{R})$

- The deformation space $\mathfrak{F}(\Sigma)$ of marked hyperbolic structures Σ identifies with the space of embeddings

$$\pi := \pi_1(\Sigma) \xrightarrow{\rho} \mathrm{PSL}(2, \mathbb{R})$$

onto *discrete subgroups*.

- Furthermore if $\gamma \neq 1$, then $\rho(\gamma)$ is hyperbolic.
- Components of $\mathrm{Hom}(\pi, \mathrm{PSL}(2, \mathbb{R}))$ are detected by the *Euler class* of the associated oriented \mathbb{RP}^1 -bundle over Σ :

$$\mathrm{Hom}(\pi, \mathrm{PSL}(2, \mathbb{R})) \xrightarrow{e} \mathbb{Z}.$$

Fricke space

Hyperbolizing
Surfaces

Surface groups

$SL(2, \mathbb{R})$

$SL(2, \mathbb{C})$

$SU(2, 1)$

$SL(3, \mathbb{R})$

$Aff(2, \mathbb{R})$

- The deformation space $\mathfrak{F}(\Sigma)$ of marked hyperbolic structures Σ identifies with the space of embeddings

$$\pi := \pi_1(\Sigma) \xrightarrow{\rho} \mathrm{PSL}(2, \mathbb{R})$$

onto *discrete subgroups*.

- Furthermore if $\gamma \neq 1$, then $\rho(\gamma)$ is hyperbolic.
- Components of $\mathrm{Hom}(\pi, \mathrm{PSL}(2, \mathbb{R}))$ are detected by the *Euler class* of the associated oriented \mathbb{RP}^1 -bundle over Σ :

$$\mathrm{Hom}(\pi, \mathrm{PSL}(2, \mathbb{R})) \xrightarrow{e} \mathbb{Z}.$$

- $|e(\rho)| \leq |\chi(\Sigma)|$ (Milnor 1958, Wood 1971)

Fricke space

Hyperbolizing
Surfaces

Surface groups

$SL(2, \mathbb{R})$

$SL(2, \mathbb{C})$

$SU(2, 1)$

$SL(3, \mathbb{R})$

$Aff(2, \mathbb{R})$

- The deformation space $\mathfrak{F}(\Sigma)$ of marked hyperbolic structures Σ identifies with the space of embeddings

$$\pi := \pi_1(\Sigma) \xrightarrow{\rho} \mathrm{PSL}(2, \mathbb{R})$$

onto *discrete subgroups*.

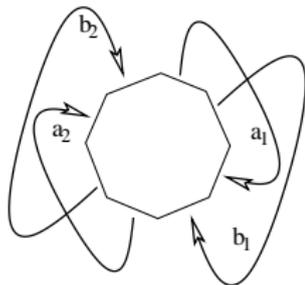

- Furthermore if $\gamma \neq 1$, then $\rho(\gamma)$ is hyperbolic.
- Components of $\mathrm{Hom}(\pi, \mathrm{PSL}(2, \mathbb{R}))$ are detected by the *Euler class* of the associated oriented $\mathbb{R}P^1$ -bundle over Σ :

$$\mathrm{Hom}(\pi, \mathrm{PSL}(2, \mathbb{R})) \xrightarrow{e} \mathbb{Z}.$$

- $|e(\rho)| \leq |\chi(\Sigma)|$ (Milnor 1958, Wood 1971)
- Equality $\iff \rho$ is a discrete embedding. (1980)

Branched hyperbolic structures

- Obtain a genus g surface from a $4g$ -gon.

Branched hyperbolic structures

Hyperbolizing
Surfaces

Surface groups

$SL(2, \mathbb{R})$

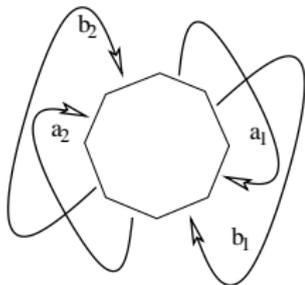

$SL(2, \mathbb{C})$

$SU(2, 1)$

$SL(3, \mathbb{R})$

$Aff(2, \mathbb{R})$

- Obtain a genus g surface from a $4g$ -gon.

- If the sum of the interior angles is $2\pi k$, where $k \in \mathbb{Z}$, then quotient space is a hyperbolic surface with one singularity (the image of the vertex) with cone angle $2\pi k$.

Branched hyperbolic structures

Hyperbolizing
Surfaces

Surface groups

$SL(2, \mathbb{R})$

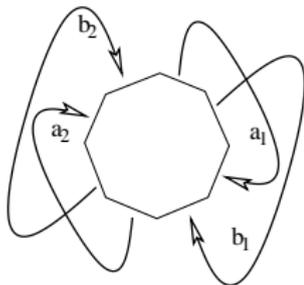

$SL(2, \mathbb{C})$

$SU(2, 1)$

$SL(3, \mathbb{R})$

$Aff(2, \mathbb{R})$

- Obtain a genus g surface from a $4g$ -gon.

- If the sum of the interior angles is $2\pi k$, where $k \in \mathbb{Z}$, then quotient space is a hyperbolic surface with one singularity (the image of the vertex) with cone angle $2\pi k$.
- The holonomy representation of a hyperbolic surface with cone angles $2\pi k_i$ extends to $\pi_1(\Sigma)$ with Euler number

$$e(\rho) = 2 - 2g + \sum k_i.$$

A hyperbolic surface of genus two

Hyperbolizing
Surfaces

Surface groups

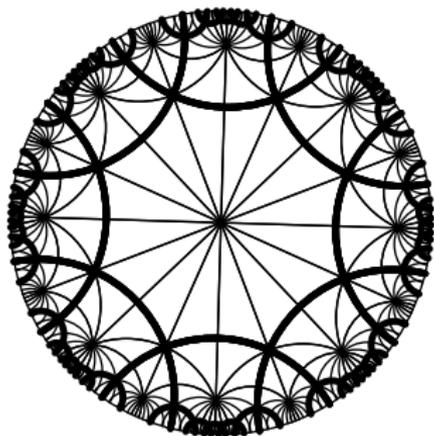

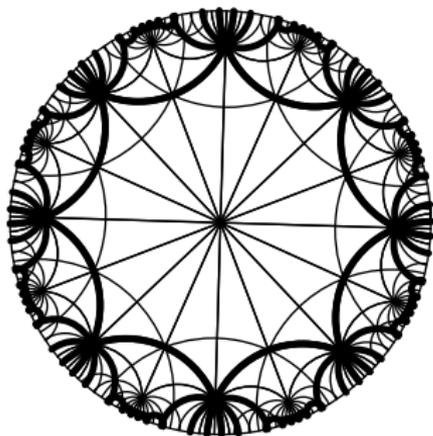

$SL(2, \mathbb{R})$

$SL(2, \mathbb{C})$

$SU(2, 1)$

$SL(3, \mathbb{R})$

$Aff(2, \mathbb{R})$

A hyperbolic surface of genus two

Surfaces

Surface groups

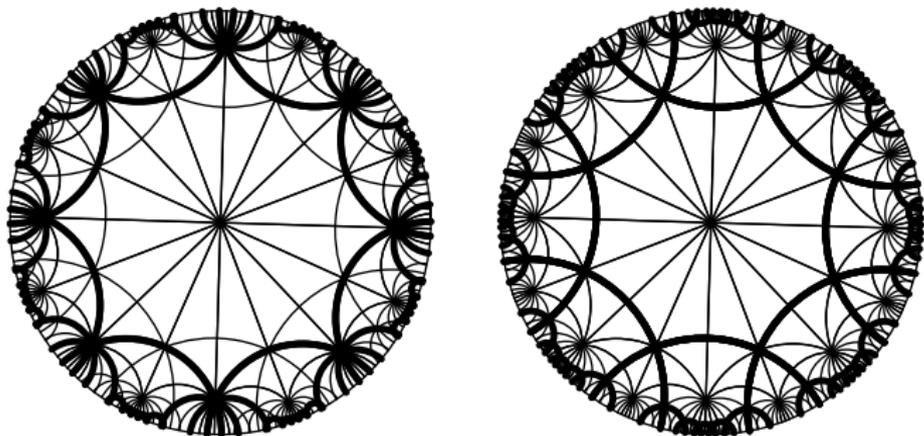

$SL(2, \mathbb{R})$

$SL(2, \mathbb{C})$

$SU(2, 1)$

$SL(3, \mathbb{R})$

$Aff(2, \mathbb{R})$

- Each component of $\text{Hom}(\pi, \text{PSL}(2, \mathbb{R}))$ contains holonomy of branched hyperbolic structures.
- The Euler class $2 - 2g + k$ component deformation retracts onto k -fold symmetric product. (Hitchin 1987)

Branched hyperbolic structures

Hyperbolizing
Surfaces

Surface groups

$SL(2, \mathbb{R})$

$SL(2, \mathbb{C})$

$SU(2, 1)$

$SL(3, \mathbb{R})$

$Aff(2, \mathbb{R})$

- Each component of $\text{Hom}(\pi, \text{PSL}(2, \mathbb{R}))$ contains holonomy of branched hyperbolic structures.
- The Euler class $2 - 2g + k$ component deformation retracts onto k -fold symmetric product. (Hitchin 1987)
- If $\Sigma \xrightarrow{f} \Sigma_1$ is a degree one map not homotopic to a homeomorphism, and Σ_1 is a hyperbolic structure with holonomy ϕ_1 , then the composition

$$\pi_1(\Sigma) \xrightarrow{f_*} \pi_1(\Sigma_1) \xrightarrow{\phi_1} \text{PSL}(2, \mathbb{R})$$

is *not* the holonomy of a branched hyperbolic structure.

Branched hyperbolic structures

Hyperbolizing
Surfaces

Surface groups

$SL(2, \mathbb{R})$

$SL(2, \mathbb{C})$

$SU(2, 1)$

$SL(3, \mathbb{R})$

$Aff(2, \mathbb{R})$

- Each component of $\text{Hom}(\pi, \text{PSL}(2, \mathbb{R}))$ contains holonomy of branched hyperbolic structures.
- The Euler class $2 - 2g + k$ component deformation retracts onto k -fold symmetric product. (Hitchin 1987)
- If $\Sigma \xrightarrow{f} \Sigma_1$ is a degree one map not homotopic to a homeomorphism, and Σ_1 is a hyperbolic structure with holonomy ϕ_1 , then the composition

$$\pi_1(\Sigma) \xrightarrow{f_*} \pi_1(\Sigma_1) \xrightarrow{\phi_1} \text{PSL}(2, \mathbb{R})$$

is *not* the holonomy of a branched hyperbolic structure.

- *Conjecture:* every representation with dense image occurs as the holonomy of a branched hyperbolic structure.

Dynamic/homotopic triviality

Hyperbolizing
Surfaces

Surface groups

$SL(2, \mathbb{R})$

$SL(2, \mathbb{C})$

$SU(2, 1)$

Surface groups

$SL(2, \mathbb{R})$

$SL(2, \mathbb{C})$

$SU(2, 1)$

$SL(3, \mathbb{R})$

$Aff(2, \mathbb{R})$

- For $G = PSL(2, \mathbb{R})$, the general symplectic structure and the complex structure from Teichmüller space are part of the *Weil-Petersson* Kähler geometry on $\mathfrak{F}(\Sigma)$.
- Decomposing Σ into pants along curves $\Gamma = \{\gamma_1, \dots, \gamma_N\}$ where $N = 3g - 3$, the *Fenchel-Nielsen mapping*

$$\begin{aligned}\mathfrak{F}(\Sigma) &\xrightarrow{\ell_\Gamma} (\mathbb{R}_+)^N \\ \langle M \rangle &\longmapsto (\ell_1(M), \dots, \ell_N(M))\end{aligned}$$

is a principal \mathbb{R}^N -bundle.

- ℓ_Γ moment map for *completely integrable Hamiltonian system*. (Wolpert 1983)

$SL(2, \mathbb{C})$

$SU(2, 1)$

$SL(3, \mathbb{R})$

$Aff(2, \mathbb{R})$

- Choose a section of ℓ_Γ to define *twist coordinates* τ_1, \dots, τ_N , to trivialize the principal bundle:

$$\mathfrak{F}(\Sigma) \approx (\mathbb{R}_+)^N \times \mathbb{R}^N.$$

- The symplectic form equals

$$\sum_{i=1}^N d\ell_i \wedge d\tau_i.$$

(Wolpert 1985)

Quasi-Fuchsian groups

Hyperbolizing
Surfaces

Surface groups

$SL(2, \mathbb{R})$

$SL(2, \mathbb{C})$

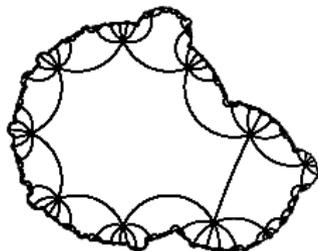

$SU(2, 1)$

$SL(3, \mathbb{R})$

$Aff(2, \mathbb{R})$

The group of orientation-preserving isometries of $H_{\mathbb{R}}^3$ equals $PSL(2, \mathbb{C})$. Close to Fuchsian representations in $PSL(2, \mathbb{R})$ are *quasi-Fuchsian representations*.

- Quasi-fuchsian representations are discrete embeddings.
- Quasi-fuchsian representations comprise a cell $Q\mathcal{F}$ upon which $Mod(\Sigma)$ acts properly.
- $Hom(\pi, SL(2, \mathbb{C}))$ is connected, and the closure of $Q\mathcal{F}$ consists of all discrete embeddings.
- The discrete embeddings are *not open* and do not comprise a component of $Hom(\pi, G)/G$.

Complex hyperbolic geometry
